ABSTRACT OF THE DISCLOSURE

An information processing apparatus supplies time information by a real-time-clock (RTC) that is corrected and a correction history is recorded. When a signal representing a correct-time indication is received, a correction processing section corrects a setting time provided from the RTC using the signal and a result of the correction is recorded into a log memory. When a signal representing a correct-time indication is not received or detected, the correction processing section records failure of correction of the setting time of the RTC into a log memory. The correction processing section is also capable of reading a history of correction information from the log memory and correcting the setting time provided by the RTC based on the correction history.
